7. Stack, without double-counting

Stack floor is n ≥ 20 (tables use n ≥ 10). Traits are added by largest parent-minus-child gap (the stack's pct against the pct of the games the trait removes), not by a fixed order. Read the hold-out first; the builder has no out-of-sample edge as a class (nine stacks picked at ≥60% on 2015–20 went 81–15 then 40–39). Under each stack: hold-out, by-season W-L, cover-margin quartiles with signed tails, parent-minus-child (the stack without each trait, and the games that trait removed), the anchor's complement, the stack split by line bucket, a contrary cross (the team's own traits that run against it on the anchor, crossed into the stack), and a hold-out (traits chosen on 2015–20 only at a scaled floor of n ≥ 10, printed on 2021–25).
